A rapid test for the qualitative detection of Chlamydia antigen in female cervical swab, male urethral swab and male urine specimens.

For professional in vitro diagnostic use only.

INTENDED USE
The Chlamydia test card is a rapid chromatographic immunoassay for the qualitative detection of Chlamydia trachomatis in female cervical swab, male urethral swab and male urine specimens to aid in the diagnosis of Chlamydia infection.

SUMMARY
Chlamydia trachomatis is the most common cause of sexually transmitted venereal infection in the world. It is composed of elementary bodies (the infectious form) and reticulate or inclusions bodies (the replicating form). Chlamydia trachomatis has both a high prevalence and asymptomatic carriage rate, with frequent serious complications in both women and neonates. Complications of Chlamydia infection in women include cervicitis, urethritis, endometritis, pelvic inflammatory disease (PID) and increased incidence of ectopic pregnancy and infertility. Vertical transmission of the disease during parturition from mother to neonate can result in inclusion conjunctivitis or pneumonia. In men, complications of Chlamydia infection include urethritis and epididymitis. At least 40% of the nongonococcal urethritis cases are associated with Chlamydia infection. Approximately 70% of women with endocervical infections and up to 50% of men with urethral infections are asymptomatic. Traditionally, Chlamydia infection has been diagnosed by detection of Chlamydia inclusions in tissue culture cells. Culture method is the most sensitive and specific laboratory method, but it is labor intensive, expensive, long (48-72 hours) and not routinely available in most institutions.

The Chlamydia test card is a rapid test to qualitatively detect the Chlamydia antigen from female cervical swab, male urethral swab and male urine specimens, providing results in 10 minutes. The test utilizes antibody specific for Chlamydia to selectively detect Chlamydia antigen from female cervical swab, male urethral swab and male urine specimens.

PRINCIPLE
The Chlamydia test card is a qualitative, lateral flow immunoassay for the detection of Chlamydia antigen from female cervical swab, male urethral swab and male urine specimens. In this test, antibody specific to the Chlamydia antigen is coated on the test line region of the test. During testing, the extracted antigen solution reacts with an antibody to Chlamydia that is coated onto particles. The mixture migrates up to react with the antibody to Chlamydia on the membrane and generate a colored line in the test line region. The presence of this colored line in the test line region indicates a positive result, while its absence indicates a negative result. To serve as a procedural control, a colored line will always appear in the control line region, indicating that proper volume of specimen has been added and membrane wicking has occurred.

REAGENTS
The test cassette contains Chlamydia antibody coated particles and Chlamydia antibody coated on the membrane.

PRECAUTIONS
- Handle all specimens as if they contain infectious agents.
- Observe established precautions against microbiological hazards throughout testing and follow standard procedures for proper disposal of specimens.
- Wear protective clothing such as laboratory coats, disposable gloves and eye protection when specimens are being tested.
- Use only sterile swabs to obtain endocervical specimens.
- Do not eat, drink or smoke in the area where the specimens or kits are handled.
- Do not use test if pouch is damaged.
- Humidity and temperature can adversely affect results.

STORAGE AND STABILITY
The kit can be stored at room temperature or refrigerated (2-30°C). The test cassette is stable through the expiration date printed on the sealed pouch. The test cassette should be stored in the sealed pouch until use.

- Do not freeze.
- Do not use beyond the expiration date.
SPECIMEN COLLECTION AND PREPARATION

- The Chlamydia test card can be performed using female cervical swab, male urethral swab and male urine specimens.
- The quality of specimens obtained is of extreme importance. Detection of Chlamydia requires a vigorous and thorough collection technique that provides cellular material rather than just body fluids.
- To collect Female Cervical Swab Specimens:
  - Use the swab provided in the kit. Alternatively, any plastic-shaft Dacron swab may be used.
  - Before specimen collection, remove excess mucus from the endocervical area with a cotton ball and discard. The swab should be inserted into the endocervical canal, past the squamocolumnar junction until most of the tip is no longer visible.
  - This will permit acquisition of columnar or cuboidal epithelial cells, which are the main reservoir of the Chlamydia organism. Firmly rotate the swab 360° in one direction (clockwise or counterclockwise), let stand for 15 seconds, then withdraw the swab. Avoid contamination from exocervical or vaginal cells. Do not use 0.9% sodium chloride to treat swabs before collecting samples.
  - If the test is to be conducted immediately, put the swab into the extraction tube.
  - To collect Male Urethral Swab Specimens:
    - Standard plastic- or wire-shaft sterile Dacron swabs should be used for urethral specimen collection. Instruct patients not to urinate for at least one hour prior to specimen collection.
    - Insert the swab into the urethra about 2-4 cm, rotate the swab 360° in one direction (clockwise or counterclockwise), let stand for 10 seconds, then withdraw. Do not use 0.9% sodium chloride to treat swabs before collecting samples.
  - If the test is to be conducted immediately, put the swab into the extraction tube.
- To collect Male Urine Specimens:
  - Collect 15-30 ml of clean first morning urine in a sterile urine cup. First morning urine specimens are preferred to achieve the highest concentrations of Chlamydia antigen.
  - Mix the urine specimen by inverting the container. Transfer 10 ml of the urine specimen into a centrifuge tube, add 10 ml distilled water and centrifuge at 3000 rpm for 15 minutes.
  - Carefully discard the supernatant, keep the tube inverted and remove any supernatant from the rim of the tube by blotting onto absorbent paper.
  - If the test is to be conducted immediately, treat the urine pellet according to the Directions for Use.
  - It is recommended that specimens be processed as soon as possible after collection. If immediate testing is not possible, the patient swab specimens should be placed in a dry transport tube for storage or transport. The swabs may be stored for 4-6 hours at room temperature (15-30°C) or 24-72 hours refrigerated (2-8°C). The urine specimens can be stored refrigerated (2-8°C) for 24 hours. Do not freeze. All specimens should be allowed to reach room temperature (15-30°C) before testing.

DIRECTIONS FOR USE

Allow the test cassette, specimen, reagents, and/or controls to reach room temperature (15-30°C) prior to testing.

1. Remove the test cassette from the sealed foil pouch and use it as soon as possible. Best results will be obtained if the test is performed immediately after opening the foil pouch.
2. Extract the Chlamydia antigen according to the specimen type.

For Female Cervical or Male Urethral Swab Specimens:
- Hold the Reagent A bottle vertically and add 5 full drops of Reagent A (approximately 300 µl) to the extraction tube. Reagent A is colorless. Immediately insert the swab, compress the bottom of the tube and rotate the swab 15 times. Let stand for 2 minutes.
- Fill the quantitative pipette for Reagent B up to the marked line (approximately 220 µl) then add the Reagent B to the extraction tube. The solution will turn cloudy. Compress the bottom of tube and rotate the swab 15 times until the solution turns to a clear color with a slight green or blue tint. If the swab is bloody, the color will turn yellow or brown. Let stand for 1 minute.
- Press the swab against the side of the tube and withdraw the swab while squeezing the tube. Keep as much liquid in the tube as possible. Fit the dropper tip on top of the extraction tube.

For Male Urine Specimens:
- Fill the quantitative pipette for Reagent B to the marked line (approximately 220 µl) then add the Reagent B to the urine pellet in the centrifuge tube, then draw the liquid up and down with a pipette to vigorously mix until the suspension is homogeneous.
- Transfer all the solution in the centrifuge tube to an extraction tube. Let stand for 1 minute. Hold the Reagent A bottle upright and add 5 full drops of Reagent A (approximately 300 µl) to the extraction tube. Vortex or tap the bottom of the tube to mix the solution. Let stand for 2 minutes.
- Fit the dropper tip on top of the extraction tube.
- Place the test cassette on a clean and level surface. Add 3 full drops of the extracted solution (approximately 100 µl) to the specimen well (S) of the test cassette, then start the timer. Avoid trapping air bubbles in the specimen well (S).
- Wait for the colored line(s) to appear. Read the result at 10 minutes. Do not interpret the result after more than 20 minutes.
Transmission of infection from mother to baby during childbirth can lead to conjunctivitis or pneumonia. In men,

**ANVENDELSE**

- Quantitative pipette
- Reagent B (0.2 N HCl)
- Reagent A (0.2 M NaOH)
- Sterile cervix swabs from women
- Test tubes
- Chlamydia test kit

Må ikke nedfryses.

Testen skal blive i den forseglede pose indtil brug.

Chlamydia test kit is a rapid chromatographic immunodiagnostic test for qualitative detection on the cervical swabs of women and urethral swabs and urine samples from men as a help in diagnosing Chlamydia infection.

**REAGENTER**

**MEDFØLGENDE MATERIALER NØDVENDIGE**

- Test kit contains particles coated with Chlamydia antibodies and Chlamydia antibodies coated on the membrane.
- A test strip is always colored in the control region, indicating sufficient sample volume, adequate membrane wicking and correct procedural technique. If the problem persists, discontinue using the test kit immediately and contact your local distributor.

**QUALITY CONTROL**

A procedural control is included in the test. A colored line appearing in the control line region (C) is considered an internal procedural control. It confirms sufficient specimen volume, adequate membrane wicking and correct procedural technique. Control standards are not supplied with this kit; however, it is recommended that positive and negative controls be tested as good laboratory practice to confirm the test procedure and to verify proper test performance.

**LIMITATIONS**

1. The Chlamydia test kit is for in vitro diagnostic use only. This test should be used for the detection of Chlamydia antigen from female cervical swabs, male urethral swabs and male urine specimens. Neither the qualitative value nor the rate of increase in Chlamydia antigen concentration can be determined by this qualitative test.
2. This test will only indicate the presence of Chlamydia antigen in specimens from both viable and non-viable Chlamydiae. Performance with specimens other than female cervical swabs, male urethral swabs and male urine has not been assessed.
3. Detection of Chlamydia is dependent on the number of organisms present in the specimen. This can be affected by specimen collection methods and patient factors such as age, history of Sexually Transmitted Diseases (STDs), presence of symptoms, etc. The minimum detection level of this test may vary according to serovar. Therefore, the test results should be interpreted in conjunction with other laboratory and clinical data available to the physician.
4. Therapeutic failure or success cannot be determined as antigen may persist following appropriate antimicrobial therapy.
5. Excessive blood on the swab may cause false positive results.

**EXPECTED VALUES**

For women attending STD clinics and other high-risk populations, the prevalence of Chlamydia infection has been reported to be between 20% and 30%. In a low-risk population such as those patients attending obstetrics and gynecology clinics, the prevalence is approximately 5% or less. Reports show that for men attending STD clinics, the prevalence of Chlamydia infection is approximately 5% in asymptomatic men and 11% in symptomatic men. Normal carriage rates of Chlamydia in asymptomatic men are less than 5%.

**PERFORMANCE CHARACTERISTICS**

Sensitivity

The Chlamydia test kit has been evaluated with specimens obtained from patients of STD clinics. PCR is used as the reference method for the Chlamydia test kit. Specimens were considered positive if PCR indicated a positive result. Specimens were considered negative if PCR indicated a negative result. The results show that Chlamydia test kit has a high sensitivity relative to PCR.
Specificity
The Chlamydia test card uses an antibody that is highly specific for Chlamydia antigen in female cervical swab, male urethral swab and male urine specimens. The results show that the Chlamydia test card has a high specificity relative to PCR.

Cross-Reactivity
The antibody used in the Chlamydia test card has been shown to detect all known Chlamydia serovars. Chlamydia psittaci and Chlamydia pneumoniae strains have not yet been tested with the Chlamydia test card. Cross-reactivity with other organisms has been studied using suspensions of 10^9 Colony Forming Units (CFU)/ml. The following organisms were found negative when tested with the Chlamydia test card:

- Acinetobacter calcoaceticus
- Pseudomonas aeruginosa
- Proteus mirabilis
- Acinetobacter spp
- Neisseria meningitidis
- N. gonorrhoeae
- Enterococcus faecalis
- Salmonella
- Group B/C Streptococcus
- Staphylococcus aureus
- Gardnerella vaginalis
- Enterococcus faecium
- Proteus vulgaris
- Candida albicans
- Branhamella catarrhalis
- Klebsiella pneumoniae
